

How can animal science contribute to a sustainable and global animal production ?

Matthias Gauly

Animal Science
Faculty of Science and Technology
Free University of Bolzano

What is Sustainable Livestock Farming ?

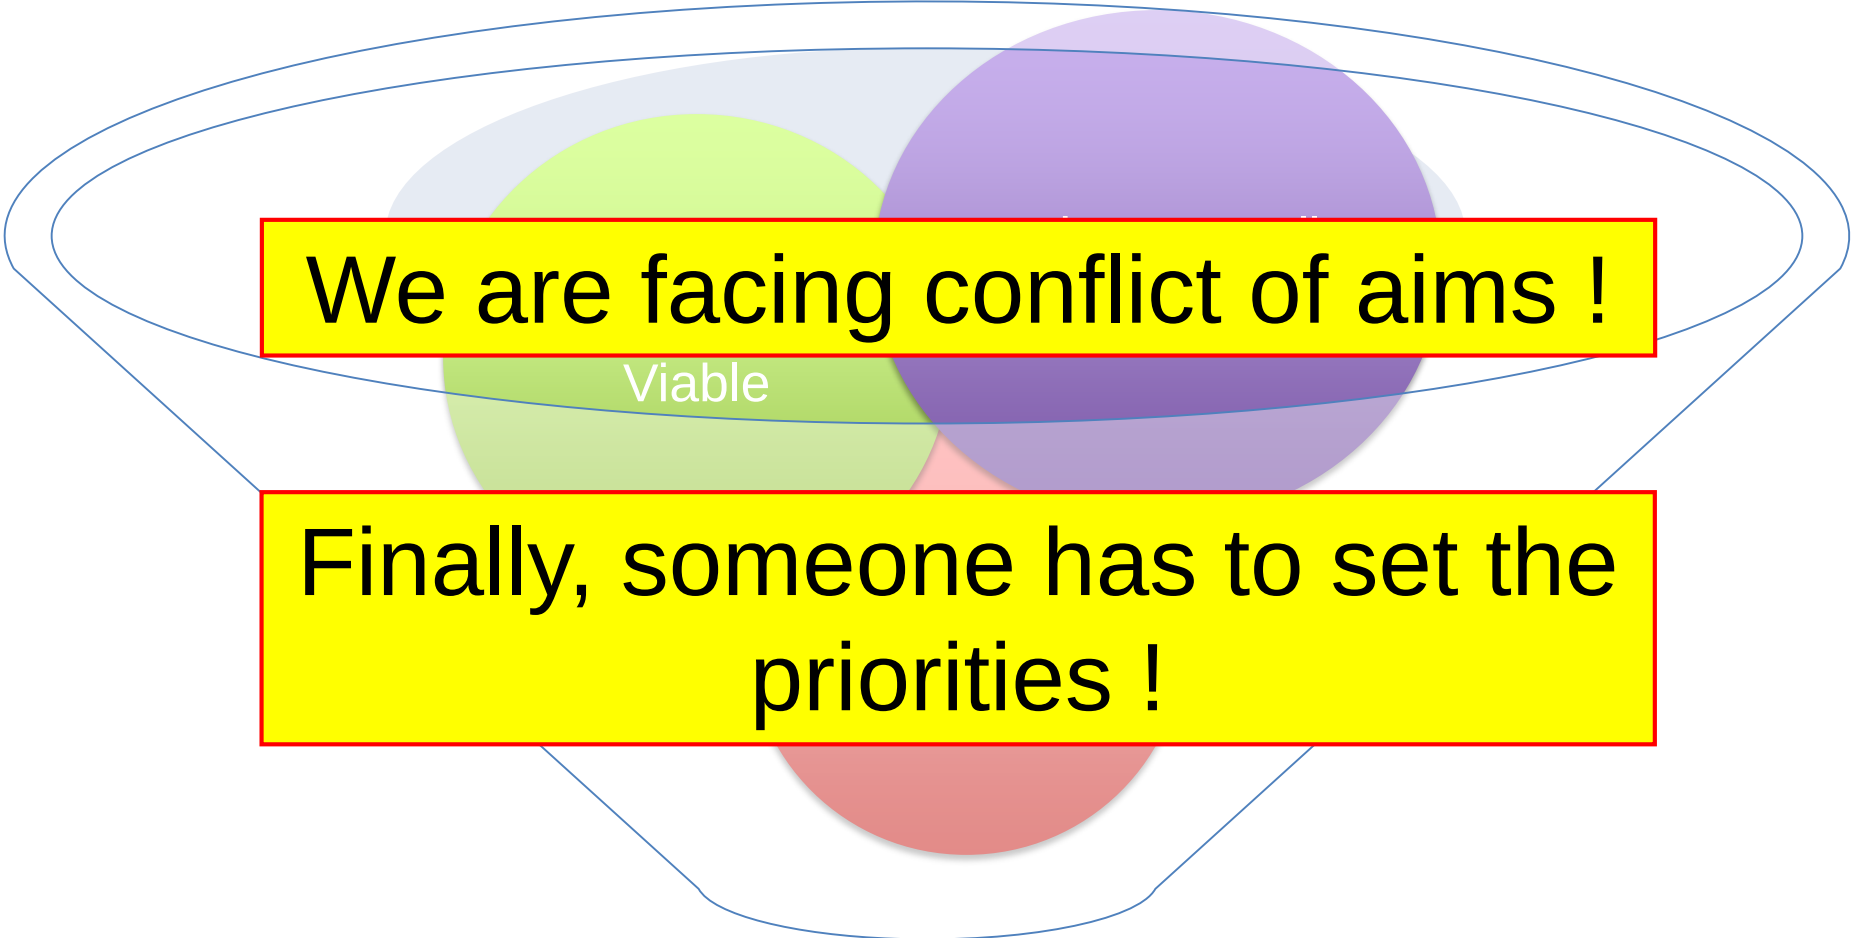

Sustainable livestock production is “the efficient production of **safe, high quality** animal products, in a way that **protects** and **improves** the **natural environment**, the **social** and **economic conditions** of farmers, their employees and local communities, and safeguards the **health** and **welfare** of all farmed species”.

What is Sustainable Livestock Farming ?

Sustainable livestock production is “the efficient

Only those production systems which
are accepted by the society will be
„sustainable“ !

and safeguards the **health** and **welfare** of all farmed
species”.

We are facing conflict of aims !

**Finally, someone has to set the
priorities !**

**Sustainable Livestock
Farming**

- Conclusions

Overview

- What is the current situation ?
- How have we arrived there ?
- What actors are involved ?
- What are the challenges ?
- How can animal science contribute ?
- Conclusions

What is the current situation ?

The global population is 7.3 billion today.

What is the current situation ?

The global population is 7.3 billion today.

Global demand for animal products is expected to double in the next decades due to an increasing global population and global wealth.

Environmental issues and animal welfare is at the heart of a discussion about an “agricultural turn-around” and the future of farming in Europe.

World Food Supply

(<http://faostat.fao.org/site/609/default.aspx#ancor>)

Percentages of Undernourished Human Population

One in seven humans is undernourished (FAO, 2015).

Share of the population that is undernourished

This is the main FAO hunger indicator. It measures the share of the population that has a caloric intake which is insufficient to meet the minimum energy requirements necessary for a given individual. Data showing as 5 may signify a prevalence of undernourishment below 5%.

Source: World Bank

Note: Developed countries are not included in the regional estimates since the prevalence is below 5%.

1/3 of produced food is lost or wasted

**30%
CEREALS
FOOD LOSSES**

In industrialized countries, consumers throw away 286 million tonnes of cereal products.

 763 billion boxes of pasta

■ Agriculture ■ Distribution
■ Post-harvest ■ Consumption
■ Processing

**45%
FRUIT & VEGETABLES
FOOD LOSSES**

Along with roots and tubers, fruit and vegetables have the highest wastage rates of any food products; almost half of all the fruit and vegetables produced are wasted.

**20%
DAIRY
FOOD LOSSES**

In Europe alone, 29 million tonnes of dairy products are lost or wasted every year.

**20%
MEAT
FOOD LOSSES**

Of the 162 million tonnes of meat produced globally, over 20% is lost or wasted.

**30%
FISH & SEAFOOD
FOOD LOSSES**

9% of fish caught globally is thrown back into the sea. In most cases they are dead, dying or badly damaged.

**45%
ROOTS & TUBERS
FOOD LOSSES**

In North America & Oceania alone, 5 014 500 tonnes of roots and tubers are wasted at the consumption stage alone.

Overview

- What is the current situation ?
- How have we arrived there at the production side ?
- What actors are involved ?
- What are the challenges ?
- How can animal science contribute ?
- Conclusions

How we have arrived here ?

Technologies supported the increase of food production.

XV Convegno AISSA, Bolzano 2018

Gauly

What influenced the application of new technologies ?

- Investments
- Culture
- Infrastructure
- Society

Western societies

Examples of successfully applied technologies in livestock

- Biotechnologies: Artificial insemination, Embryo transfer
- Unifeed
- Computerized systems
- Vaccines, Antibiotics
- Milking technology
- Refrigerating systems
- Genetic evaluation
- Molecular techniques, Genomic application
- ...

Overview

- What is the current situation ?
- How have we arrived there ?
- **What actors are involved ?**
- What are the challenges ?
- How can animal science contribute ?
- Conclusions

Involved actors

The development of the involved actors

Farms in Europe

Less farms with a high level of specialisation

Increased size

Close to market requirements
and less to traditions

High performing genotypes

Increase of performance between 1970 and 2014

Industry

Fewer global actors

Strong lobbying to policy makers

World standardization of products

High request of production efficiency

Important impact on livestock farming

Policy makers

Decisions about trading

Selective but decreasing support to farming systems

Animal Welfare and Health, Environmental rules

Consumers and civil society

Increase in population size

In

animal products

Changing habits
(e.g. vegetarianism)

Developed world
animal welfare

Habits

based

NGOs have a powerful influence on policy makers and consumers and therefore to farmers and industry

Research

More short term objectives

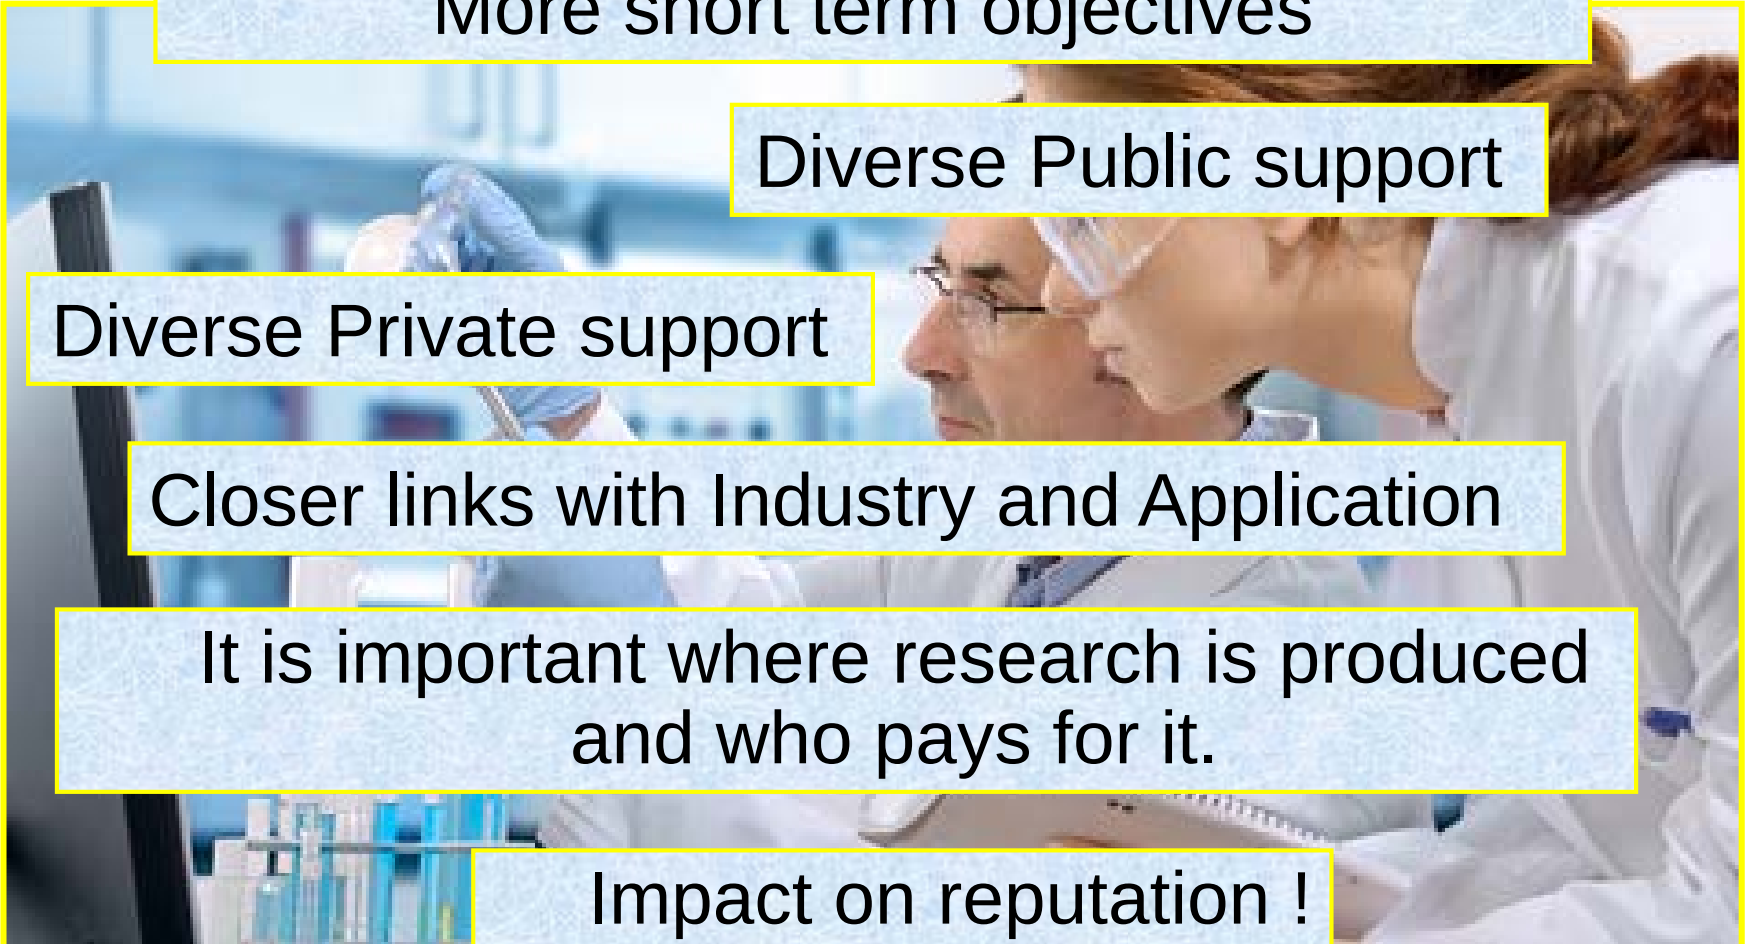

Diverse Public support

Diverse Private support

Closer links with Industry and Application

It is important where research is produced
and who pays for it.

Impact on reputation !

How is the image of science and technology ?

Image of Science and Technology

QC8. To what extent do you agree with the following statements?

We can no longer trust scientist to tell the truth about controversial scientific and technological issues because they depend more and more on money from industry

Private funding of scientific and technological research limits our ability to understand things fully

Scientists are only looking at very specific scientific and technological issues. This makes them unable to oversee problems from a wider perspective

Nowadays, the problems we are facing are so complex that specialists in science and technology are no longer able to understand them

Total "agree"

Neither agree nor disagree

Total "disagree"

Don't know

The major challenge is

to satisfy the increasing
global request of
animal products for low
prices and

to meet at the same
time the societies
constraints regarding
environment and
animal welfare !

The current (and future) social, technical and economic situations do not favourite a single solution.

The challenges for a sustainable production

- Lack of application of technologies
- Environment / Regional concentration / Climate change
- Feedstuff scarcity
- Animal health and welfare (e.g. drug use and resistance)
- Image of animal farming in the society
 - e.g. Farm size („Industrial livestock production“)

2008: 14,000

The challenges for a sustainable production

- Lack of application of technologies
- Environment / Regional concentration / Climate change
- Feedstuff scarcity
- Animal health and welfare (e.g. drug use and resistance)
- Image of animal farming in the society
 - e.g. Farm size („Industrial livestock production“)

What is the current situation ?

- Livestock contributes about 14.5% (7,100 MtCO₂/year) of the total **GHG emissions**, exceeding that from transportation.

What is the current situation ?

- Agricultural **nitrogen surpluses** show a declining trend, thereby potentially reducing environmental pressures on soil, water and air.
- Many countries, however, still maintain a large surplus.

Nitrate load in ground water

- positive situation (< 50 mg Nitrate/l)
- negative situation (SRU, 2015)

What is the problem with animal health and welfare ?

Some examples

1. Layers
2. Dairy cows

Some examples

1. Layers
2. Dairy cows

The laying hen and bone fractures in relation to the husbandry system (Sandilands at al., 2007)

	Conventional cage	Furnished cage	Free- range	Barn
Farms, n = (100 animals/farm)				
Birds with bone fracture (%)				

Birds examined after depopulation (24 farms) for bone fractures.

The laying hen and bone fractures in relation to the husbandry system (Sandilands at al., 2007)

	Conventional cage	Furnished cage	Free- range	Barn
Farms, n = (100 animals/farm)	8	4	9	3
Birds with bone fracture (%)	49	43	54	68

53 % of the animals had at least one fracture!!!!

The laying hen and bone fractures in relation to the husbandry system (Sandilands et al., 2007)

	Conventional cage	Furnished cage	Free-range	Barn
Fracture rate (%)	49	43	54	68

Genotype ? Performance ?

53 % of the animals had at least one fracture!!!!

Some examples

How can Animal Science contribute ?

1. Assessment of Life-cycles → tune livestock policies to socioeconomic and geographic environments.
2. Reducing environmental footprint → research in genetics, feeding, management and husbandry.
3. Research about the improved use of livestock in different regions by using local resources, breeds and feedstuffs → produce tangible evidence to convince local farmers.
4. Sustainably managed grazing → increase biodiversity, maintain ecosystem services and improve carbon capture by plants and soil.

Reducing environmental footprint

1. Management / Husbandry:

- Adopting management practices to keep animals healthy and increase welfare (e.g. by reduce overcrowding, hygiene programs).
- Technical solutions to reduce emissions.
- Enhancing diversity (e.g. adapted breeds) within animal production systems to strengthen their resilience.

2. Feeding:

- Adopt smart supplements e.g. which encourage microbes in the rumen to grow quickly and to provide better nutrition or/and to alter the rumen microbial population to use nitrogen and energy more efficiently (Lee et al., 2009).

Reducing environmental footprint

3. Genetics:

- Optimizing the metabolic functioning. E.g. breeding for reduced Methane production (heritability = 0.3, Pszczola et al., 2017).
- Implementation of new functional traits.
- Selection for profitable animals under different production systems (Scollan et al., 2006).

The challenges for a sustainable production

- Lack of application of technologies
- Environment / Regional concentration / Climate change
- Feedstuff scarcity
- Animal health and welfare (e.g. drug use and resistance)
- Image of animal farming in the society
 - e.g. Farm size („Industrial livestock production“)

How can Animal Science contribute ?

1. Society education: disseminate broadly the outcomes of accurate research activities

From a scientific point of view, there is little or no relation between animal welfare and farm size!

(e.g. Gieseke et al., 2015; Meyer-Hamme et al., 2015)

Dairy cattle

Repeated farm visits.

Trait	1	2	3	4
Dairy cows, n =	< 100	100 - 300	300 - 500	> 500
Farms, n =	8	17	7	7
Mean no. of cows	69	174	384	924
Min – Max	47 - 90	105 - 285	330 - 483	575 - 1582

(Gieseke et al., 2015)

Welfare Quality® Assessment Protocol

Results – Dairy cows

Scores increased in tendency with farm size.

(Gieseke et al., 2015)

How can Animal Science contribute ?

1. Society education: disseminate broadly the outcomes of accurate research activities.
2. Support the discussion on food security by putting forward scientific facts.
3. Lobbying for and strengthening specific research funds to answer food security problems.
4. Face and solve the problems: improvement of husbandry (production) systems, animal welfare and health.

Overview

- What is the current situation ?
- How have we arrived there ?
- What actors and forces have been involved ?
- What are the challenges ?
- How can animal science contribute ?
- **Conclusions**

Conclusions

- Science and research should predict and guide the reality and not being behind.
- When referring to Livestock Production, the future is not a fixed time but a dynamic and changeable period.
- Different situations in different environments.
- It is extremely important to predict societies constraints and economic and environment conditions → conflicting goals!
- The interaction of different scientific fields is essential

There will be no one-size-fits-all solutions.

Thank you very much
for your attention!
